# Endpoint Security

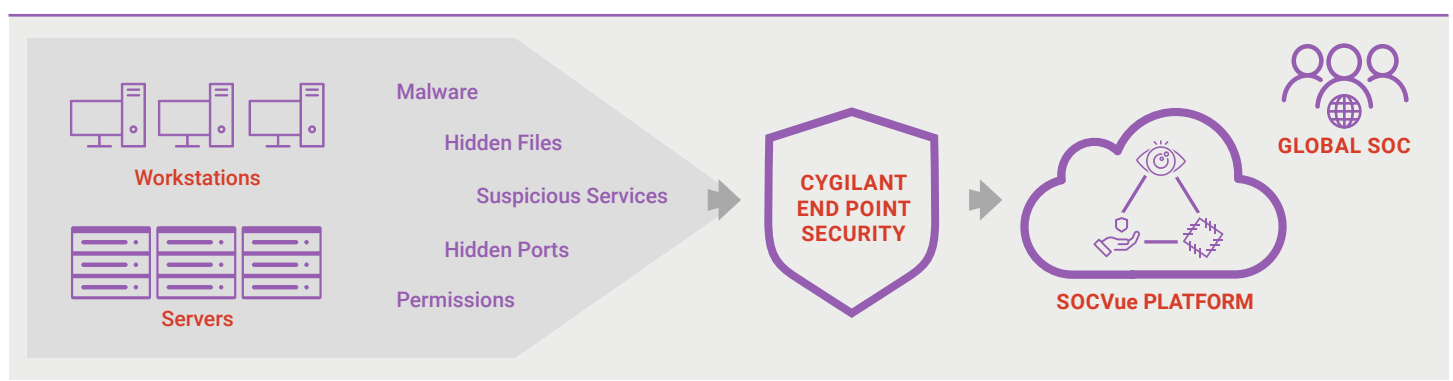

## Next gen malware detection

In today's networks, it is no longer good enough to shield critical assets behind perimeter defenses. Attackers are more sophisticated and craft exploits that mimic legitimate traffic. These attack vectors are designed to evade signature-based defenses. On top of that, endpoints are roaming from network to network or utilizing resources in cloud data centers that are not under corporate control. IT security analysts need direct insight into suspicious activity occurring directly on the endpoints. That's where next-gen antimalware and endpoint security technologies come in to play.

Cygilant Managed Detection & Response (MDR) service includes Cygilant Endpoint Security, next-generation malware detection for workstations and servers. The technology provides increased visibility into suspicious activity and potential threats. Fully managed by Cygilant, you'll gain significant time and cost savings compared to deploying traditional endpoint products.

### How Cygilant Endpoint Security Works

Cygilant Endpoint Security is an agent-based solution that collects real-time security data from critical assets, detects suspicious files, services, and other activity, and streams alerts to the 24x7 Cygilant Security Operations Center for investigation.

### Benefits

- Fully managed and a fraction of the cost of complicated point products
- Combined with network intrusion detection, event log monitoring, and threat intelligence for one dashboard view of your cybersecurity posture
- Monitored 24x7 by the Cygilant SOC
- Peace of mind to achieve your security and compliance goals
